Hello!

I am a fullstack software engineer currently spending most of my time working in C#, specifically with ASP.NET core. I also have experience with SQL and Microsoft SQL Server as well as Angular and TypeScript. Primarily I work on internal tools that allow our trading team to see real time market data and run reports on the trade impact.

I have demonstrated abilities in communication – often bridging the gap between the technical and business side. A lot of my current work is taking complex business tactics and turning them into flexible and sustainable coding patterns. I have advocated for and composed documentation for my team, as well as for our users. I have worked end to end: producing cards, estimating work, planning sprints, generating functionality, reviewing code, and participating in the deployment process.

In my next role I'm primarily looking for a trusting, empathetic development team. I'm open to leaning new technologies as well as taking my current stack a level deeper. I think I bring compassion and humor to the workplace and look forward to chatting with you about the position and the company culture you offer.

Stay safe,

Michaela
